1. The following is an examiner's statement of reasons for allowance:

The primary reason for the allowance of claims 1-20 is that none of the references cited, taken either singly or in combination, teach or fairly suggest a method of recovering oil from a pattern element of a subterranean formation, as in the claimed combinations, including the step in claim 1 of "decreasing water injection rate into the higher completion interval ... for a selected time, while maintaining a selected gas injection rate into the lower completion interval ... so as to increase rate of gas flow upward in the formation and form a mixed flow zone in the formation ... then continuing water injection into the higher completion interval for fluid injection". The cited references also fail to teach or fairly suggest a method of oil recovery from a pattern element of a subterranean formation comprising the combination of steps of claim 14, including the steps of "selecting the rate and times of gas injection and water injection based on the computer simulations to predict a WAG ratio to be injected into the upper completion interval so as to cause gas injected into the lower completion interval ... to flow to the upper boundary ... and the completion interval ... at about the same time; injecting gas and water at selected rates to cause the predicted WAG ratio." For example, the reference to Stone (4,427,067) conducts a computer simulation(s) prior to a WAG oil displacement process, but only selects or determines a single or total injection rate for all the fluids injected, and fails to teach or suggest the continuous injection of gas into a lower completion interval, while decreasing the water injection rate into a higher completion interval for a selected time.
